

Ch1. 利息度量.

1. 累积函数: $a(t)$, 单位元在时间 t 的累积值. 单位元: $a(0) = 1$.

2. 实际利率: i . $i = a(1) - a(0) = \frac{\text{当期利息}}{\text{期初本金}} = \frac{a(1) - a(0)}{a(0)}$

3. 单利: $a(t) = 1 + it$ 如: 国债 实际利率 $\downarrow$

4. 复利: $a(t) = (1+i)^t$

5. 贴现: 贴现函数 $a'(t) = (1+i)^{-t}$

(1) 贴现因子: $v = \frac{1}{1+i} \Rightarrow t$ 年贴现因子: v^t

(2) 累积因子: $(1+i)$

(3) 实际贴现率: d , $d_t = \frac{a(t) - a(t-1)}{a(t)} = \frac{i}{1+i} \Rightarrow a(t) = (1-d)^{-t}$

(4) 关系: $d = iv$ $d = \frac{i}{1+i} = 1 - \frac{1}{1+i} = 1 - v$

6. 名义利率:

(1) $i^{(m)}$, 每年计息 m 次, 或 $\frac{1}{m}$ 年计息一次

(2) 与实际利率 (i) 的关系: $1+i = (1 + \frac{i^{(m)}}{m})^m$

7. 名义贴现率:

(1) $d^{(m)}$ 指每 $\frac{1}{m}$ 时期的实际贴现率为 $\frac{d^{(m)}}{m}$.

(2) 与实际贴现率 (d) 的关系: $1-d = (1 - \frac{d^{(m)}}{m})^m$

$$\star 1+i = (1 + \frac{i^{(m)}}{m})^m = (1 - \frac{d^{(m)}}{m})^{-m} = (1-d)^{-1} = v^{-1} = e^{\delta}$$

$$\star \text{由于 } i-d = id \Rightarrow \frac{i^{(m)}}{m} - \frac{d^{(m)}}{m} = \frac{i^{(m)}}{m} \cdot \frac{d^{(m)}}{m}$$

8. 利息力: 度量资金在每一个时点上 (无穷小的时间区间) 增长的强度

在时间区间 $[t, t+h]$ 的实际利率为 $\frac{a(t+h) - a(t)}{a(t)} \Rightarrow$ 对应的年名义利率 (一年包括 $1/h$ 个小区间) 为 $\frac{a(t+h) - a(t)}{h \cdot a(t)}$

$$\therefore \delta_t \stackrel{\text{def.}}{=} \lim_{h \rightarrow 0} \frac{a(t+h) - a(t)}{h \cdot a(t)} = \frac{a'(t)}{a(t)} = [\ln a(t)]' \quad \text{部分时间获取钱的能力不同.}$$

$\star$ 复利 $a(t) = (1+i)^t$, 则 $\delta = [t \ln(1+i)]' = \ln(1+i)$ (常数) $\Rightarrow a(t) = e^{\delta t}$.

$\star$ 复利的利息力非常数时 $a(t) = e^{\int_0^t \delta_s ds}$ 当 $\delta_s = \delta$ 时 $\rightarrow a(t) = e^{\delta t}$, 即复利的普通情况.

$\star$ 另一解释 (名义利率): $\lim_{m \rightarrow \infty} i^{(m)} = \lim_{m \rightarrow \infty} m[(1+i)^{1/m} - 1] \stackrel{\text{令 } x=1/m}{=} \lim_{x \rightarrow 0} \frac{(1+i)^x - 1}{x} \stackrel{\text{L'H}}{=} \lim_{x \rightarrow 0} (1+i)^x \ln(1+i) = \ln(1+i)$

$\star d \leq d^{(1)} \leq d^{(2)} \leq \dots \leq \delta \leq \dots \leq i^{(2)} \leq i^{(1)} \leq i$ (钱这值钱越不值钱)

Ch2. 等额年金

1. 期末付年金:

$$a_{\overline{n}|i} = v + v^2 + \dots + v^n \quad (1)$$

$$(1) \text{ 现值: } a_{\overline{n}|i} = v + v^2 + \dots + v^n \quad (\text{first principle}) \quad (1+i)a_{\overline{n}|i} = 1 + v + \dots + v^{n-1} \quad (2)$$

$$(2) - (1) \Rightarrow ia_{\overline{n}|i} = 1 - v^n \Rightarrow a_{\overline{n}|i} = \frac{1-v^n}{i}$$

↓

$$(2) \text{ 累积值: } s_{\overline{n}|i} = (1+i)^{n-1} + (1+i)^{n-2} + \dots + (1+i) + 1 = a_{\overline{n}|i}(1+i)^n = \frac{(1+i)^n - 1}{i}$$

$$ia_{\overline{n}|i} + v^n = 1$$

先息后本的现值与本金相等

$$\frac{1}{a_{\overline{n}|i}} = \frac{1}{s_{\overline{n}|i}} + i$$

2. 期初付年金:

等额还款 & 先息后本 (现值与累积值本金的分配)

$$(1) \text{ 现值: } \ddot{a}_{\overline{n}|i} = 1 + v + v^2 + \dots + v^{n-1} \quad (1) \quad v\ddot{a}_{\overline{n}|i} = v + v^2 + \dots + v^n \quad (2) \quad (1) - (2) \Rightarrow (1-v)\ddot{a}_{\overline{n}|i} = 1 - v^n \Rightarrow \ddot{a}_{\overline{n}|i} = \frac{1-v^n}{1-v} = \frac{1-v^n}{d}$$

$$(2) \text{ 累积值: } \ddot{s}_{\overline{n}|i} = (1+i)^0 + (1+i)^1 + \dots + (1+i)^{n-1} = \ddot{a}_{\overline{n}|i}(1+i)^n = \frac{(1+i)^n - 1}{d} \Rightarrow \frac{1}{\ddot{a}_{\overline{n}|i}} = \frac{1}{\ddot{s}_{\overline{n}|i}} + d \quad d\ddot{a}_{\overline{n}|i} + v^n = 1$$

小结: 期初 & 期末付年金关系

$$(1) a_{\overline{n}|i}(1+i) = \ddot{a}_{\overline{n}|i} \Rightarrow \ddot{a}_{\overline{n}|i}v = a_{\overline{n}|i} \quad \ddot{a}_{\overline{n}|i} > a_{\overline{n}|i}$$

$$(2) a_{\overline{n}|i} \frac{i}{d} = \frac{1-v^n}{i} \frac{i}{d} = \frac{1-v^n}{d} = \ddot{a}_{\overline{n}|i}$$

$$(3) \ddot{a}_{\overline{n}|i} = a_{\overline{n+1}|i} - 1 \quad a_{\overline{n}|i} \leftarrow \overbrace{1 \quad 1 \quad 1 \quad 1 \quad \dots \quad 1}^{a_{\overline{n+1}|i}} \rightarrow s_{\overline{n}|i}$$

$$\ddot{s}_{\overline{n}|i} = s_{\overline{n+1}|i} - 1 \quad \ddot{a}_{\overline{n}|i} \leftarrow \overbrace{1 \quad 1 \quad 1 \quad 1 \quad \dots \quad 1}^{\ddot{s}_{\overline{n+1}|i}} \rightarrow \ddot{s}_{\overline{n}|i}$$

3. 延期年金

$$0 \quad 1 \quad 2 \quad \dots \quad m-1 \quad m \quad m+1 \quad \dots \quad m+n-1 \quad m+n$$

$$(1) \text{ 延期期末付: } {}_m|a_{\overline{n}|i} = v^m + v^{m+1} + \dots + v^{m+n} = v^m a_{\overline{n}|i} = v^{m+1} \ddot{a}_{\overline{n}|i} = a_{\overline{m+n}|i} - a_{\overline{m}|i}$$

$$(2) \text{ 延期期初付: } {}_m|\ddot{a}_{\overline{n}|i} = v^m + v^{m+1} + \dots + v^{m+n-1} = v^m \ddot{a}_{\overline{n}|i} \quad \Rightarrow {}_m|\ddot{a}_{\overline{n}|i} \cdot v = {}_m|a_{\overline{n}|i}$$

4. 永续年金

$$\lim_{n \rightarrow \infty} a_{\overline{n}|i} = \lim_{n \rightarrow \infty} \frac{1-v^n}{i} = \frac{1}{i} \Rightarrow \lim_{n \rightarrow \infty} \ddot{a}_{\overline{n}|i} = \lim_{n \rightarrow \infty} \frac{1-v^n}{d} = \frac{1}{d}$$

$$\dot{a}_{\overline{n}|i} = a_{\overline{n}|i} - {}_n|a_{\overline{n}|i} = \frac{1}{i} - \frac{v^n}{i} = \frac{1-v^n}{i}$$

练习: 一笔10万元的遗产:

- 第一个10年将每年的利息付给受益人A,
- 第二个10年将每年的利息付给受益人B,
- 二十年后将每年的利息付给受益人C.
- 遗产的年收益率为7%, 请确定三个受益者的相对受益比例。

$$0 \quad 1 \quad 2 \quad 3 \quad 4 \quad 5 \quad 6 \quad \dots \quad 100 \times 7\% = 7000$$

$$A: 7000 a_{\overline{10}|7\%}$$

$$B: 7000 {}_{10}|a_{\overline{10}|7\%} = 7000(a_{\overline{20}|7\%} - a_{\overline{10}|7\%})$$

$$C: 7000 {}_{20}|a_{\overline{\infty}|7\%} = 7000(a_{\overline{\infty}|7\%} - a_{\overline{20}|7\%})$$

$$\text{证明: } {}_m|a_{\overline{n}|i} = a_{\overline{m+n}|i} - a_{\overline{m}|i} - v^{m+n} a_{\overline{n}|i}$$

$$\Leftrightarrow a_{\overline{m+n}|i} = a_{\overline{m}|i} + {}_m|a_{\overline{n}|i} + v^{m+n} a_{\overline{n}|i} \quad \text{理论证明: } = \frac{1}{i} - \frac{1-v^m}{i} - v^{m+n} \frac{1}{i}$$

$$= \frac{1}{i} [1 - (1-v^m) - v^{m+n}] = \frac{v^m}{i} (1-v^n) = {}_m|a_{\overline{n}|i}$$

6. 可变利率年金

累积值(终值): $100 S_{\overline{6}|i_1} (1+i_2)^4 + 100 S_{\overline{4}|i_2}$

or $100 \ddot{S}_{\overline{6}|i_1} (1+i_2)^4 + 100 \ddot{S}_{\overline{4}|i_2} + 100$

year 6 放前 or 放后.

7. 每年支付 m 次年金: $a_{\overline{n}|}^{(m)} = \frac{1-v^n}{i^{(m)}}$

其效果同等于 $\frac{1}{m} a_{\overline{mn}|} @ \frac{i^{(m)}}{m} = \frac{1-v^{mn}}{m i} = \frac{1}{m} \frac{1-(1+i^{(m)}/m)^{mn}}{i^{(m)}/m}$

年初支付: $a_{\overline{n}|}^{(m)} (1 + \frac{i^{(m)}}{m}) = \ddot{a}_{\overline{n}|}^{(m)}$

$$\Rightarrow \ddot{a}_{\overline{n}|}^{(m)} = \frac{1-v^n}{d^{(m)}}$$

$$\Rightarrow a_{\overline{n}|}^{(m)} (1+i)^{\frac{1}{m}} = \ddot{a}_{\overline{n}|}^{(m)}$$

8. 连续支付的年金

$$\bar{a}_{\overline{n}|} = \int_0^n v^t dt = \int_0^n e^{-\delta t} dt = \frac{1-e^{-\delta n}}{\delta} = \frac{1-v^n}{\delta} = \lim_{m \rightarrow \infty} a_{\overline{n}|}^{(m)} = \lim_{m \rightarrow \infty} \frac{1-v^n}{i^{(m)}} = \frac{1-v^n}{\delta}$$

Review: $v = \frac{1}{1+i} = 1-d = e^{-\delta}$, (δ 为常数)

$$\Rightarrow \bar{S}_{\overline{n}|} = (1+i)^n \bar{a}_{\overline{n}|} = \int_0^n (1+i)^{n-t} dt$$

价值方程: $PV(\text{inflows}) = PV(\text{outflows})$

债务偿还

一. 分期偿还法: 借款人分期偿还贷款, 还款金额包括利息+本金 (未必每次偿还数额相等)

1. 等额分期偿还

(1) 每次偿还金额: $L_0 = R a_{\overline{n}|}$ L_n : 还完第 n 年欠款后剩余欠款.

(2) 未偿还本金余额: $L_k = R a_{\overline{n-k}|}$ (将来法)

$L_k = L_0 (1+i)^k - R S_{\overline{k}|}$ (过去法: L_0 在现在的价值 - 已还款项的累积值)

证明: 将来法 = 过去法

$$R a_{\overline{n-k}|} = R \frac{1-v^{n-k}}{i}$$

$$L_0 (1+i)^k - R S_{\overline{k}|} = R a_{\overline{n}|} (1+i)^k - R (1+i)^k a_{\overline{k}|}$$

(3) 本息分离

I_t = 第 t 次还款的利息部分 $I_t = L_{t-1} \cdot i = i \cdot R a_{\overline{n-t+1}|} = R (1-v^{n-t+1})$

P_t = 第 t 次还款的本金部分 $P_t = R - I_t = R v^{n-t+1}$

A & B 借 \$10000, 每季等额还款, $i = 8\% \text{ p.y. for } 6 \text{ year}$. $6 \times 4 = 24$

卖 C 每季 10%

$$P_8 = Rv^{n-8+1} = 24-8+1.$$

$$Ra_{\overline{n}|i} = \frac{8\%}{4} = 0.02 = 10000 \Rightarrow R = 528.71.$$

$$L_8 = Ra_{\overline{n-8}|i} = Ra_{\overline{16}|0.02}$$

$$\text{Selling Price} = Ra_{\overline{n}|i} = 6902.31,$$

$$C: 16R - 6902.31$$

$$B: -10000 + 6902.31 + 8R$$

2nd year
实际 $i > j$

$$(1+i)^{n-1} + (1+j)^{n-2} + S_{n-2}|j$$

$$S_{n-2}|j + (1+i)^{n-1}$$

① $X_1 > 1$ at time 1.

$$1 \cdot a_{\overline{n}|i} = X_1 \ddot{a}_{\overline{n}|i} (1+j)^{-1}$$

$$\text{其实亦可写成 } v_i \ddot{a}_{\overline{n}|i} = X_1 \ddot{a}_{\overline{n}|i} v_j$$

$$\Rightarrow \frac{1}{1+i} = X_1 \frac{1}{1+j}$$

② $1 \cdot a_{\overline{n}|i} = X_2 a_{\overline{n}|j}$

sinking fund
= 等额偿债基金: 借款人分期偿还贷款利息, 同时累积一笔偿债基金, 用于到期时偿还贷款本金

i = 贷款利率

I = 每期还款利息 = iL_0

j = 偿债基金利率 $\Rightarrow D$ = 每期向偿债基金中存入金额

if: $i = j \Rightarrow I + D = R$

$$\Rightarrow I + D = iL_0 + \frac{L_0}{S_{\overline{n}|j} = i}$$

$$= L_0 (i + \frac{1}{S_{\overline{n}|j}})$$

$$= \frac{L_0}{a_{\overline{n}|i}} = R.$$

$$DS_{\overline{n}|j} = L_0$$

$$\text{Review: } i + \frac{1}{S_{\overline{n}|j}} = \frac{1}{a_{\overline{n}|i}}$$

Ch? 债券和股票

一. 债券定价的基本原理

P = 债券价格

F = 债券面值 (par value / face value)

i = 债券的到期收益率 (YTM, IRR)

r = 债券息票率 (coupon rate)

$\rightarrow rF$ = 息票收入

C = 债券的偿还值, 一般 $C = F$ (除非提前还款)

n = 息票次数 (未必是时间长度)

1. 基本公式

$$\begin{array}{c} rF \quad rF \quad rF \quad \dots \quad rF \quad rF+C \\ 0 \quad 1 \quad 2 \quad 3 \quad \dots \quad n-1 \quad n \end{array} \quad P = rF a_{\overline{n}|i} + \underline{Cv^n} = \sum_{k=1}^n rF (1+i)^{-k} + \underline{C(1+i)^{-n}} \quad \text{偿还值=面值, 亦可写作 } Fv^n.$$

2. 溢价公式

$$g = \text{修正息票率} = \text{息票收入}/C, \quad r = \text{息票率} = \text{息票收入}/\text{面值}$$

$$\text{推导: } P = rF a_{\overline{n}|i} + Cv^n$$

$$= rF a_{\overline{n}|i} + C(1 - ia_{\overline{n}|i})$$

$$= C + (rF - iC) a_{\overline{n}|i}$$

$$= C + (gC - iC) a_{\overline{n}|i}$$

$$= C + C(g - i) a_{\overline{n}|i}$$

理解:

$$\Rightarrow P - C = (g - i)C \cdot a_{\overline{n}|i}$$

3. 账面价值 (book value)

V_t = 在时点 t 时, 持有人在债券上的投资余额.

(1) t 为整数时, 价格与账面值相等. 假设到期收益率 i 保持不变.

$$\text{① 将来法} \begin{cases} \text{i. 基本公式: } V_t = rF a_{\overline{n-t}|i} + Cv^{n-t} \\ \text{ii. 溢价公式: } V_t = C + C(g - i) a_{\overline{n-t}|i} \end{cases}$$

$$\text{② 过去法: } V_t = P(1+i)^t - rF \cdot S_{\overline{t}|i} \quad (P \text{ 在 } t \text{ 时刻的终值} - [0, t] \text{ 时内所有 } rF \text{ 的累积值})$$

$$\text{证明: 过去法} = P(1+i)^t - rF \cdot S_{\overline{t}|i}$$

$$= (rF a_{\overline{n}|i} + Cv^n) (1+i)^t - rF a_{\overline{n}|i} (1+i)^t$$

$$= rF (a_{\overline{n}|i} - a_{\overline{n-t}|i}) (1+i)^t + Cv^{n-t}$$

$$= rF \cdot {}_t|a_{\overline{n-t}|i} (1+i)^t + Cv^{n-t}$$

$$= rF \cdot V_t^t a_{\overline{n-t}|i} (1+i)^t + Cv^{n-t}$$

$$= rF a_{\overline{n-t}|i} + Cv^{n-t} = \text{将来法.}$$

$$\text{递推公式: } V_t = V_{t-1}(1+i) - rF.$$

(2) 任意时点上的价格和账面值.

$$\begin{cases} \text{过去法: } P_t = P_0(1+i)^t \\ \text{将来法: } P_t = (rF + P_1)(1+i)^{-(t-1)} \end{cases} \Leftrightarrow rF + P_1 = P_0(1+i)$$

$\Rightarrow$ 账面价值 $V_t = P_0(1+i)^t - \underbrace{(rF)_t}_{\text{从0到t应计利息收入}}$

$\hookrightarrow$ i) 按复利: $(rF)_t = \frac{rF}{i} [(1+i)^t - 1]$

ii) 按单利: $(rF)_t = trF$

$\Rightarrow$ 因此有三种方法计算账面值: i) 理论方法: $V_t = P_0(1+i)^t - \frac{rF}{i} [(1+i)^t - 1]$

ii) 半理论方法: $V_t = P_0(1+i)^t - trF$ ★

iii) 实践方法: $V_t = P_0(1+fi) - trF$

4. 基本公式: $iG = rF$. 推导: $P = rFa_n + Cv^n = iGa_n + Cv^n$

$$= G(1-v^n) + Cv^n$$

$$= G + (C-G)v^n$$

Ch: 收益率

1. 净现值 $NPV = \sum_{t=0}^n v^t R_t$

收益率 $NPV(i) = \sum_{t=0}^n v^t R_t = 0 \Rightarrow IRR$

2. 中值加权: A_0 : 本金. C_t : t 时刻新增投资. (仅考虑一个时期)

期末累积值: $A_0(1+i) + \sum_t C_t(1+i)^{t+1} = A_1 \Rightarrow i$: 收益率

近似: $A_0(1+i) + \sum_t C_t(1+i)^{t+1}$

$$\approx A_0(1+i) + \sum_t C_t(1+i(1-t))$$

$$= i \left(A_0 + \sum_t C_t(1-t) \right) + \left(A_0 + \sum_t C_t \right) \approx A_1$$

$$\Rightarrow i = \frac{A_1 - (A_0 + \sum_t C_t)}{A_0 + \sum_t C_t(1-t)} = \frac{I}{A_0 + \sum_t C_t(1-t)}$$

3. 时间加权

$A(0)$: 期初本金. A_k : 第 k 个时间区间的累积值. C_k : 新增投资. $A(1)$: 期末累积
